

CSE 421/521 PA1 Phase 1: Priority Scheduling

The objective of this assignment is to implement a simple priority thread scheduler in Pintos. The assignment can be broken up into the following:

- Find your team name and team members on the assignment announcement.
- Accept the classroom assignment invite and try to join your team. If you can't find your team, proceed to next line.
- If you can't find your team, try creating it. Name the team exactly like the name in the team spreadsheet all lowercase; you can try copy-pasting it in.
- Watch the recitation videos for PA1 Phase 1 on UBLearns. If you can't find it, we'll make it available shortly. Please feel free to watch the recitation videos for Phase 2 and 3 too to get ahead.
- Clone your team's assignment repository. You will use this repository for all phases of PA1.
- The goal of this phase is to pass the first three tests of Priority Scheduling: `priority-change`, `priority-fifo`, and `priority-preempt`.
- Find and edit relevant code in `pintos/src/threads/`
- You can run the phase's tests by running `make check`. We've restricted the test cases to the 3 tests above for your convenience, but you can either edit `pintos/src/tests/threads/Make.tests` to add more tests or run your desired test directly (like PA0).
- We will be using Autolab to evaluate your work. Instructions for how to make submissions to Autolab will be out shortly so please watch out for that.
- I strongly encourage you and your team use GitHub to collaborate; this means regularly committing and pushing your work. Assuming your team splits the work (**it must**), you can work in branches and then merge all your changes to avoid commit conflicts. It's also important to communicate or meet regularly to ensure you're not working on anything redundant.

This is a relatively small part of PA1, and you will eventually have to pass all of the threads tests, i.e. alarms, priority scheduling, and advanced schedulers (MLFQS). I encourage you to work ahead of the phases and try to pass more tests, but it's not necessary. If you want to run more tests with `make check`, then edit `pintos/src/tests/threads/Make.tests`.

Aside from that, **START EARLY**.
