

CSE 421/521 PA1: Submitting to Autolab

Here are some steps to follow when submitting to Autolab:

- Head over to <https://autolab.cse.buffalo.edu> and check if you have access to the course page there. If not, please contact us ASAP.
- You have two ways to submit your work to Autolab:
 1. On Autolab, you have the option to connect your GitHub account and allow Autolab to clone your team's repository. Once you give Autolab permission, you can then select your team's repository, branch, and commit to be graded.
 2. Alternatively, in your container, navigate to `/home/pintos` and run the following command:

```
cd src; make clean; cd ..; tar czf pa1.tgz src/
```

You can copy it from this PDF and paste it. This will create a tarball that you can upload to Autolab. To copy the tarball to your host machine, you can run the following in your host machine:

```
docker cp pintos_container:/home/pintos/pa1.tgz <directory in host OS>
```

- Once you've decided your submission method, go to assignment **PA1 Phase #** where # is the phase number. Under **Options**, click **Group Options**.
- In **Group Options**, you should form your group by creating it, inviting your members, and then confirming the invitations; this group would be your assigned team.
- Creating your group on Autolab ensures all of your team members get credit for the submission. **All members must confirm their membership before submission. Unconfirmed members will get a zero otherwise.** Once everyone in your team has confirmed, head back to the PA1 Phase 1 page for submission.
- Choose your preferred method of submission (GitHub or File Upload) and make sure you have complied with the course's academic integrity policy.
- Allow up to 2 minutes for the Autolab job to finish; you should see your score in a couple seconds typically. Once a team member submits, the submission and its score will be applied to all team members in the group. **When you click on the score, it will show you the full result of the job.**

Please make an early submission, so that you can make sure everything is right, and the submission works well. If not, there is enough time to handle it.
